

# Combining multiple imputations

Thomas Lumley

May 7, 2010

Carlin *et al.* (2003) illustrate the use of their Stata texttt for multiple imputations with data from a cohort study of adolescent health. Five sets of imputations were done, separately for male and female participants. The resulting datasets are in `mitools/dta`.

First we read all the datasets into R, using `read.dta` from the `foreign` package.

```
> library(mitools)
> data.dir <- system.file("dta", package = "mitools")
> library(foreign)
> women <- imputationList(lapply(list.files(data.dir, pattern = "f.\\.dta",
+     full = TRUE), read.dta, warn.missing.labels = FALSE))
> men <- imputationList(lapply(list.files(data.dir, pattern = "m.\\.dta",
+     full = TRUE), read.dta, warn.missing.labels = FALSE))
```

We now combine the imputations for men and women, first defining a `sex` variable

```
> women <- update(women, sex = 0)
> men <- update(men, sex = 1)
> all <- rbind(women, men)
> all

MI data with 5 datasets
Call: rbind(deparse.level, ...)

> colnames(all)
```

```

[1] "id"      "wave"     "mmetro"   "parsmk"   "drkfre"    "alcdos"
[7] "alcdhi"  "smk"       "cistot"   "mdrkfre"  "sex"

Now tabulate drinking frequency by sex

> with(all, table(sex, drkfre))

[[1]]
drkfre
sex Non drinker not in last wk <3 days last wk >=3 days last wk
  0        282            201            105            12
  1        207            194            134            35

[[2]]
drkfre
sex Non drinker not in last wk <3 days last wk >=3 days last wk
  0        282            195            109            14
  1        200            200            132            38

[[3]]
drkfre
sex Non drinker not in last wk <3 days last wk >=3 days last wk
  0        278            202            109            11
  1        209            194            131            36

[[4]]
drkfre
sex Non drinker not in last wk <3 days last wk >=3 days last wk
  0        284            188            114            14
  1        203            206            128            33

[[5]]
drkfre
sex Non drinker not in last wk <3 days last wk >=3 days last wk
  0        288            191            109            12
  1        206            192            136            36

attr(,"call")
with(all, table(sex, drkfre))

```

and define a new ‘regular drinking’ variables.

```
> all <- update(all, drkreg = as.numeric(drkfre) > 2)
> with(all, table(sex, drkreg))

[[1]]
drkreg
sex FALSE TRUE
 0    483   117
 1    401   169

[[2]]
drkreg
sex FALSE TRUE
 0    477   123
 1    400   170

[[3]]
drkreg
sex FALSE TRUE
 0    480   120
 1    403   167

[[4]]
drkreg
sex FALSE TRUE
 0    472   128
 1    409   161

[[5]]
drkreg
sex FALSE TRUE
 0    479   121
 1    398   172

attr(,"call")
with(all, table(sex, drkreg))
```

We can now fit a logistic regression model for trends over time in drinking:

```
> model1 <- with(all, glm(drkreg ~ wave * sex, family = binomial()))
> MIcombine(model1)
```

Multiple imputation results:

```
with(all, glm(drkreg ~ wave * sex, family = binomial()))
MIcombine.default(model1)
      results      se
(Intercept) -2.25974358 0.26830731
wave         0.24055250 0.06587423
sex          0.64905222 0.34919264
wave:sex     -0.03725422 0.08609199
```

```
> summary(MIcombine(model1))
```

Multiple imputation results:

```
with(all, glm(drkreg ~ wave * sex, family = binomial()))
MIcombine.default(model1)
      results      se      (lower      upper) missInfo
(Intercept) -2.25974358 0.26830731 -2.78584855 -1.7336386   4 %
wave         0.24055250 0.06587423  0.11092461  0.3701804  12 %
sex          0.64905222 0.34919264 -0.03537187  1.3334763   1 %
wave:sex     -0.03725422 0.08609199 -0.20623121  0.1317228   7 %
```

For model objects with `coef` and `vcov` methods the extraction of coefficients and variances is automatic, but `MIextract` can still be used:

```
> beta <- MIextract(model1, fun = coef)
> vars <- MIextract(model1, fun = vcov)
> summary(MIcombine(beta, vars))
```

Multiple imputation results:

```
MIcombine.default(beta, vars)
      results      se      (lower      upper) missInfo
(Intercept) -2.25974358 0.26830731 -2.78584855 -1.7336386   4 %
wave         0.24055250 0.06587423  0.11092461  0.3701804  12 %
sex          0.64905222 0.34919264 -0.03537187  1.3334763   1 %
wave:sex     -0.03725422 0.08609199 -0.20623121  0.1317228   7 %
```
