Package 'evaluate'

November 1, 2023

Type Package

Title Parsing and Evaluation Tools that Provide More Details than the Default

Version 0.23

Description Parsing and evaluation tools that make it easy to recreate the command line behaviour of R.

License MIT + file LICENSE

URL https://github.com/r-lib/evaluate

BugReports https://github.com/r-lib/evaluate/issues

Depends R (>= 3.0.2)

Imports methods

Suggests covr, ggplot2, lattice, rlang, testthat (>= 3.0.0), withr

RoxygenNote 7.2.3

Encoding UTF-8

Config/testthat/edition 3

NeedsCompilation no

R topics documented:

---

evaluate   *Evaluate input and return all details of evaluation.*

Description

Compare to [eval()](), evaluate captures all of the information necessary to recreate the output as if
you had copied and pasted the code into a R terminal. It captures messages, warnings, errors and
output, all correctly interleaved in the order in which they occured. It stores the final result, whether
or not it should be visible, and the contents of the current graphics device.

Usage

```
evaluate(
  input,
  envir = parent.frame(),
  enclos = NULL,
  debug = FALSE,
  stop_on_error = 0L,
  keep_warning = TRUE,
  keep_message = TRUE,
  log_echo = FALSE,
  log_warning = FALSE,
  new_device = TRUE,
  output_handler = default_output_handler,
  filename = NULL,
  include_timing = FALSE
)
```

Arguments

input	input object to be parsed and evaluated. May be a string, file connection or function. Passed on to [parse_all()]().
envir	environment in which to evaluate expressions.
enclos	when envir is a list or data frame, this is treated as the parent environment to envir.
debug	if TRUE, displays information useful for debugging, including all output that evaluate captures.

stop_on_error   if 2, evaluation will halt on first error and you will get no results back. If 1, evaluation will stop on first error without signaling the error, and you will get back all results up to that point. If 0 will continue running all code, just as if you'd pasted the code into the command line.

keep_warning, keep_message

whether to record warnings and messages; if FALSE, messages will be suppressed; if NA, they will not be captured (normally they will be sent to the console). Note that if the environment variable R_EVALUATE_BYPASS_MESSAGES is set to true, these arguments will always be set to NA, meaning that messages will not be captured by this function.

log_echo, log_warning

If TRUE, will immediately log code and warnings (respectively) to stderr.

new_device   if TRUE, will open a new graphics device and automatically close it after completion. This prevents evaluation from interfering with your existing graphics environment.

output_handler   an instance of [output_handler()](#) that processes the output from the evaluation. The default simply prints the visible return values.

filename   string overrriding the [base::srcfile()](#) filename.

include_timing   if TRUE, evaluate will wrap each input expression in system.time(), which will be accessed by following replay() call to produce timing information for each evaluated command.

---

flush_console   *An emulation of flush.console() in evaluate()*

Description

When [evaluate()](#) is evaluating code, the text output is diverted into an internal connection, and there is no way to flush that connection. This function provides a way to "flush" the connection so that any text output can be immediately written out, and more importantly, the text handler (specified in the output_handler argument of evaluate()) will be called, which makes it possible for users to know it when the code produces text output using the handler.

Usage

```
flush_console()
```

Note

This function is supposed to be called inside evaluate() (e.g. either a direct evaluate() call or in **knitr** code chunks).

---

new_output_handler   *Custom output handlers.*

Description

An output_handler handles the results of evaluate(), including the values, graphics, conditions.
Each type of output is handled by a particular function in the handler object.

Usage

```
new_output_handler(
  source = identity,
  text = identity,
  graphics = identity,
  message = identity,
  warning = identity,
  error = identity,
  value = render,
  calling_handlers = list()
)
```

Arguments

source	Function to handle the echoed source code under evaluation.
text	Function to handle any textual console output.
graphics	Function to handle graphics, as returned by recordPlot().
message	Function to handle message() output.
warning	Function to handle warning() output.
error	Function to handle stop() output.
value	Function to handle the values returned from evaluation. If it only has one argument, only visible values are handled; if it has more arguments, the second argument indicates whether the value is visible.
calling_handlers	
	List of calling handlers. These handlers have precedence over the exiting handler installed by evaluate() when stop_on_error is set to 0.

Details

The handler functions should accept an output object as their first argument. The return value of the
handlers is ignored, except in the case of the value handler, where a visible return value is saved in
the output list.

Calling the constructor with no arguments results in the default handler, which mimics the behavior
of the console by printing visible values.

Note that recursion is common: for example, if value does any printing, then the text or graphics
handlers may be called.

Value

A new `output_handler` object

---

parse_all	*Parse, retaining comments.*

Description

Works very similarly to parse, but also keeps original formatting and comments.

Usage

```
parse_all(x, filename = NULL, allow_error = FALSE)
```

Arguments

x	object to parse. Can be a string, a file connection, or a function. If a connection, will be opened and closed only if it was closed initially.
filename	string overriding the file name
allow_error	whether to allow syntax errors in `x`

Value

A data.frame with columns `src`, the source code, and `expr`. If there are syntax errors in `x` and `allow_error = TRUE`, the data frame has an attribute `PARSE_ERROR` that stores the error object.

---

replay	*Replay a list of evaluated results.*

Description

Replay a list of evaluated results, as if you'd run them in an R terminal.

Usage

```
replay(x)
```

Arguments

x	result from [evaluate()](#)

Examples

```
samples <- system.file("tests", "testthat", package = "evaluate")
if (file_test("-d", samples)) {
    replay(evaluate(file(file.path(samples, "order.R"))))
    replay(evaluate(file(file.path(samples, "plot.R"))))
    replay(evaluate(file(file.path(samples, "data.R"))))
}
```
