

The **l3pdftools** module  
temporary collection of pdf related commands  
LaTeX PDF management testphase bundle

The L<sup>A</sup>T<sub>E</sub>X Project\*

Version 0.95v, released 2023-02-14

## 1 l3pdftools documentation

This module collects a number of candidate commands for the l3pdf module

---

`\pdf_name_from_unicode_e:n` \* `\pdf_name_from_unicode_e:n`  $\{ \langle content \rangle \}$

---

New: 2021-02-14

This converts  $\langle content \rangle$  to a format suitable for a PDF Name. The output depends on the backend: For almost all backends it will first expand the content with `\text_expand:n` and then escape it in the way needed in a PDF Name with `\str_convert_pdfname:e`, and at last prepend a slash before. Typically such names use only ascii, but non-ascii is supported, but should be utf8 encoded. For example

`\pdf_name_from_unicode_e:n {A~B\c_percent_str C\c_hash_str D€}}`

will output `/A#20B#25C#23D#E2#82#AC`.

With dvips it will expand the content with `\text_expand:n` and then wrap it in a `cvn` operation (“convert to name”). So the example above will output `(A B%C#D€) cvn` to the postscript. The content should not contain unbalanced parentheses with dvips.

---

\*E-mail: [latex-team@latex-project.org](mailto:latex-team@latex-project.org)

---

<code>\pdf_string_from_unicode:nnN</code>	<code>\pdf_string_from_unicode:nnN</code>	<code>{\langle format \rangle}</code>	<code>{\langle content \rangle}</code>	<code>{\langle tlvar \rangle}</code>
---	---	---------------------------------------	--	--------------------------------------

---

New: 2020-07-04

---

This converts  $\langle content \rangle$  following the rules defined by  $\langle format \rangle$  and stores the result in  $\langle tlvar \rangle$ . The assignment is done locally. Non-ascii input should be utf8 encoded. Currently the following formats exist:

**utf8/string-raw** this converts with `\str_set_convert:Nnnn` into utf8/string.

**utf8/string** this converts into utf8/string and adds parentheses around the result.

**utf8/URI-raw** this converts with `\str_set_convert:Nnnn` into utf8/url and then replaces reserved and digits back from the percent encoding. Parentheses are escaped.

**utf8/URI** this converts into utf8/URI and adds parentheses around the result.

**utf16/string-raw** this converts with `\str_set_convert:Nnnn` into utf16/string.

**utf16/string** this converts into utf16/string and adds parentheses around the result.

**utf16/hex-raw** this converts into utf16/hex

**utf16/hex** this converts into utf16/hex and adds bracket around the result.

## 1.1 BDC operator / Properties resource

Entries to the /Properties dictionary in the page resources can be added with dvips only through side-effects: if a BDC-mark is created dvips/ghostscript will automatically create the necessary objects and names. To get a sensible abstraction the code does the same for the other backends if the core management code has been activated. This means that the behaviour of the command is different then. The `\pdf_bdcobject:..` should only be used if the management is active.

---

<code>\pdf_bdc:nn</code>	<code>\pdf_bdc:nn</code>	<code>{\langle tag \rangle}</code>	<code>{\langle dictionary content \rangle}</code>
--------------------------	--------------------------	------------------------------------	---

---

Updated: 2020-07-03

---

This command adds a BDC marked content operator to the current page stream.  $\langle tag \rangle$  is the tag of this operator (without the leading slash),  $\langle dictionary content \rangle$  is the content of the second argument. If the PDF resource management is active an dictionary object with the content is created and referenced with a name in the BDC operator. Without the resource management the content is used directly. It then depends on the backend how it is handled: with dvips a name is used while the pdfmode engines and dvi2pdfmx write the content into the stream.

---

<code>\pdf_bdcobject:nn</code>	<code>\pdf_bdcobject:nn</code>	<code>{\langle tag \rangle}</code>	<code>{\langle object name \rangle}</code>
--------------------------------	--------------------------------	------------------------------------	--

---

New: 2020-07-03

---

This command adds a BDC marked content operator to the current page stream.  $\langle tag \rangle$  is the tag of this operator (without the leading slash),  $\langle object name \rangle$  is a the name of an dictionary object reserved with `\pdf_object_new:n` and filled with `\pdf_object_write:nnn` with the properties of the BDC. Reusing a predefined object can save space but the command works correctly only if the resources management has been activated and should be used only if this can be ensured.

<hr/> <code>\pdf_bdcobject:n</code> <hr/>	<code>\pdf_bdcobject:n {&lt;tag&gt;}</code>
<code>Updated: 2020-07-03</code> <hr/>	This command adds a BDC marked content operator to the current page stream. <code>&lt;tag&gt;</code> is the tag of this operator (without the leading slash). As object this commands uses the last anonymous dictionary object created with <code>\pdf_object_unnamed_write:nn</code> . It lies in the responsibility of the user that the last object is the wanted one. Like with <code>\pdf_bdcobject:nn</code> the command works correctly only if the resources management has been activated and should be used only if this can be ensured.
<hr/> <code>\pdf_bmc:n</code> <hr/>	<code>\pdf_bmc:n {&lt;tag&gt;}</code>
<code>New: 2019-10-17</code> <hr/>	This command created a BMC marked content operator. The argument is the tag without the leading slash. It can be e.g. used for simple artifact markers.
<hr/> <code>\pdf_emc:</code> <hr/>	<code>\pdf_emc:</code>
<code>New: 2019-06-30</code> <hr/>	This command closes the BDC marked content operator opened with <code>\pdf_bdc:nn</code> . It should be on the same page as the bdc-command.
	<pre> \pdf_object_new:n      {module/objA} \pdf_object_write:nnn {module/objA}{dict}{/Type/Artifact} \pdf_bdc:nn {Span}{module/objA} text \pdf_emc: </pre>

## 2 l3pdftools implementation

```

2 \ProvidesExplPackage{l3pdftools}{2023-02-14}{0.95v}
3 {candidate commands for l3pdf---LaTeX PDF management testphase bundle}
4 </header>
5 <@@=pdf>
6 <*package>

```

### 2.1 Conversions and export functions

```

\pdf_name_from_unicode_e:n
\pdf_name_from_unicode_e:V
7 \cs_generate_variant:Nn \str_convert_pdfname:n { e }
8
9 \cs_new:Npn \pdf_name_from_unicode_e:n #1
10 {
11   \__kernel_pdf_name_from_unicode_e:n { #1 }
12 }
13
14 \cs_generate_variant:Nn \pdf_name_from_unicode_e:n {V}

```

(End definition for `\pdf_name_from_unicode_e:n`. This function is documented on page 1.)

The convert command must use a different value the source encoding depending on the engines. Until the PR in str-convert is active we add the alias here too

```

15 \bool_lazy_any:nTF
16 {
17   \sys_if_engine luatex_p:

```

```

18   \sys_if_engine_xetex_p:
19   }
20   {
21   \prop_gput:Nnn \g__str_alias_prop { default } { }
22   }
23   {
24   \prop_gput:Nnn \g__str_alias_prop { default } { utf8 }
25   }

```

`\pdf_string_from_unicode:nnN`

```

26 \cs_new:Npn \pdf_string_from_unicode:nnN #1 #2 #3
27 {
28   \cs_if_exist_use:cF { __pdf_string_from_unicode_#1:nN }
29   {
30     \__kernel_msg_error:nnn { pdf } { unknown-convert } {#1}
31     \use_none:nn
32   }
33   { #2 } #3
34 }
35
36 \cs_generate_variant:Nn \pdf_string_from_unicode:nnN {nVN}

```

(End definition for `\pdf_string_from_unicode:nnN`. This function is documented on page 2.)

Most converter are simply wrapper around the str-convert commands and so use the same names, with the addition raw if no delimiters are added. The exception is the one for url's: it reverts most of the percent encodings and escapes the parentheses. That's why its name is URI instead of url. The current code is probably quite slow and will need a replacement.

```
