NAME

 memoize-clean.pl, memoize-clean.py - Remove (stale) memo and extern files

SYNOPSIS

 memoize-clean.pl [*OPTIONS*] [*document1.mmz ...*]

 memoize-clean.py [*OPTIONS*] [*document1.mmz ...*]

DESCRIPTION

 memoize-clean is a script accompanying Memoize, a TeX package which allows the author to reuse the results of compilation-intensive code such as TikZ pictures.

 By default, this script removes stale memo and extern files. A stale memo or extern is an extern produced during a compilation of a previous version of the document which was neither used nor produced during the last compilation of the document. Typically, stale files arise when we change the memoized code (or its context).

 memoize-clean.pl removes all memo and extern files with prefixes mentioned in the listed **.mmz** files and by options **--prefix** which are not explicitly mentioned in the **.mmz** files.

 Before deleting anything, **memoize-clean.pl** lists all the files it would delete and asks for confirmation.

OPTIONS

 -p, --prefix

  Add a memo/extern prefix for cleaning. This option may be given multiple times.

 -a, --all Remove all memos and externs, rather than only the stale ones.

 -y, --yes

  Do not ask for confirmation.

 -q, --quiet

  Don't describe what's happening.

 -h, --help

  Show help.

 -V, --version

  Show the Memoize version number and exit.
